#### 1 Normalization

#### 1.1 Background

HIV patients untreated, health control RNASeq data Normalization and QC (quality control).

Start with the counts table, and compare different normalization methods. DESeq2, TPM, TMM...

DESeq2 is inter-sample comparison normalization method, assuming the majority of the genes are not differentially expressed.

The top commonly used methods are DESeq (median-of-ratios) and TMM (Trimmed Mean of M values)-edgeR. DESeq and TMM-edgeR were reported to have overall better performance, based on the false positive rate and detection power.

#### 1.2 Filter Criteria and QC

```
# import unnormalized counts table
cnts.raw <- read.delim("All_Sample_geneCounts_raw_counts.txt",</pre>
    header = TRUE, sep = "\t")
cnts.treated.raw <- read.xlsx("HIV-1_infected_HAART_treated_Raw_Counts.xlsx")</pre>
head(cnts.raw)

### **Control vs. HIV Boxplot (With Filtering TPM Normalization)**

Based on the RLE plots, Boxplots and PCA plots, DESeq2 and TMM of edgeR normalization methods are better. Based on the medians in the RLE plots, the DESeq normalization method was chosen. # Differential Expression Analysis

#### 1.4 DESeq2 Method

The standard differential expression analysis steps in DESeq2 were chosen. The adjusted p value cutoff was set as 0.1 or 0.05. The Benjamini-Hochberg procedure controlling false discovery rate (FDR) was used to conduct the p-values adjustment.

The TMM in edgeR was chosen based on the RLE (relative log expression) plot. We are in favor of more equal spreads across samples.

#### IFN-beta Genes: HIV Infected vs Health Control

■ NS ■ log2 Fold Change >= 1 ■ adjusted p-value <= 0.05 ● adjusted p-value <= 0.05 & log2 Fold Change</p>

# 2.2.1 How many of them are significantly altered in the clinical gut biopsies? (Uninfected vs HIV infected).

For the Core ISGs list, there are 230genes, where 230 of them are in the differential expression list found by DESeq2 with FDR  $\leq 0.1$  and 124 of them are FDR  $\leq 0.05$ .

For the IFN-Beta specific genes list, there are 423 genes, where 423 of them are FDR  $\leq$  0.1, and 137 of them are FDR  $\leq$  0.05.

#### 2.2.2 Association between genes and clinical outcomes
